

ICON™ | Bi-fold Operator

Bi-fold Operator

Key Features

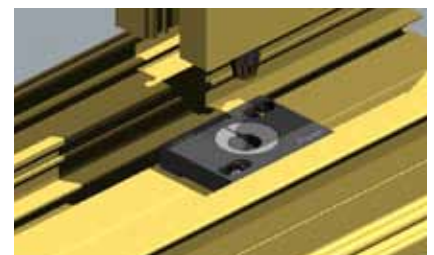

- This swivel bi-fold operator throws locking bolts into the frame at top and bottom of the panel. Optional key-locking (separately installed) is available.
- Having an operator handle located centrally on say a bi-fold door removes the need to bend down or stretch to reach flush bolts that might be located at the ends of the stiles.
- The ICON™ handle is rectangular and crisp with no visible fasteners when handle is in the closed position.
- Furniture only available in 316 grade stainless steel.
- Low line furniture ensures the handle won't strike adjoining panels when doors are in the open position.
- Matching hinged door lever furniture.

ICON™ bi-fold activator can be supplied non-key locking as shown above. The furniture is only available in 316 grade stainless steel.

ICON™ bi-fold activator can also be supplied in a key locking format.

On Series 410 Bi-fold doors the keeper in head and sill is adjustable. This allows the panels to be tightened on the frame if required.

The stainless steel bolt tips are supported by extruded aluminium guides. This ensures the bolts fall in the right location and that they can withstand high wind loads when required.

The bi-fold activator motor sits snugly in the frame and is positioned with nylon spacers again to ensure the bolts are in the right location in relation to head and sill.
